Worksheet for Quiz 7 (and Exam 3)

• Here is a way to understand the calculation of molar mass: If you imagine "ripping apart" 1 mole of C_5H_{12} into atoms, you'll have 5 moles of C + 12 moles of H, so "molar mass" is (5 mol C)(12 g/mol) + (12 mol H)(1 g/mol) = 72 g/mol, with $60 \text{ g of } C + 12 \text{ g of } H = 72 \text{ g } C_5H_{12}$

Problem-Solving Tips

Almost always, if grams are "given" you will convert this to moles by using moles/gram; and if moles are "given" you will convert this to grams by using grams/mole. For example, in #4a "g/mol" is used twice (flipped & as-is) and in-between you use the mole/mole reaction-ratio to convert from moles of what you are GIVEN into moles of what you are asked to FIND.

If you are asked to find an AMOUNT, you **must** begin with an AMOUNT, and then use conversion factors (= 1) to convert it into a different description of the same AMOUNT.

If you are asked to find a RATIO, either you can begin with a RATIO or (more commonly) use the "miles/hour strategy" as in this example: if you know that a sample of n-octane has mass = 265 g, and volume = 379 mL, to find its density in g/mL you divide the g by mL, (265 g / 379 mL) = .699 g/mL.

- **5a.** What is the mass of 234 mL n-C₈H₁₈? (density = .70 g/mL)
- **5b**. What is the volume of 164 g of $n-C_8H_{18}$?
- **5c**. If 234 mL of n- C_8H_{18} is 164 g of it, what is its density?
- **6a**. Write 4 equations, for incomplete combustion (to $CO+H_2O$) and complete combustion (CO_2+H_2O) for butane & butene.
- **6b.** 43.8 g of butane produces _____ g of CO with incomplete combustion, and _____ g of CO₂ with complete combustion.
- 7. What is the name, formula, and molar mass of the alkanes with 1-8 carbons? the 7 smallest alkenes and alkynes (how many C's do they have) with only one C=C or triple bond?
- **2a.** In a complete combustion of 43.8 grams C_5H_{12} , what mass of CO_2 (in g) is produced? **2b.** In the complete combustion of 43.8 tons C_5H_{12} , what weight of CO_2 (in tons) is produced?
- 3a. What weight of CO_2 (in grams) is produced by the complete combustion of 1 gallon of gasoline? (1 gallon = 3785 mL; assume gasoline is pure octane; C_8H_{18} density = .700 g/mL) [answer is 8180 g; a solution-setup is at end of worksheet]

ANSWERS for Problems — 5a-5b-5c, 6a-6b, 7

- 5a. 234 mL (.70 g / 1 mL) = 164 g 5b. 164 g (1 mL / .70 g) = 234 mL
- $\frac{50}{5c}$. (134 g / 234 mL) = .701 g/mL
- <u>6a</u>. butane incomplete: $2 C_4H_{10} + 9 O_2 \rightarrow 8 CO + 10 H_2O$ butane complete: $2 C_4H_{10} + 13 O_2 \rightarrow 8 CO_2 + 10 H_2O$

but an ecomplete: $2 C_4H_{10} + 13 O_2 \rightarrow 8 CO_2 + 10 H_2O$ but en e incomplete: $2 C_4H_8 + 8 O_2 \rightarrow 8 CO_2 + 8 H_2O$

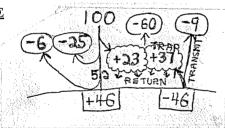

butene complete: $2 C_4H_8 + 12 O_2 \rightarrow 8 CO_2 + 8 H_2O$ note: Cutting coefficient-#s in half is ok if they represent moles (... + 4.5 mol O_2 ...) not molecules. Compared with incomplete combustion for 1 mole of C_4H_{10} (or C_4H_8), why is 2 more moles O_2 required for complete combustion? Why is 1 mole less H_2O produced per mole of butene, compared with butane?

- $\underline{\mathbf{6b}}$. C₄H₁₀ -- incomplete (84.6 g CO), complete (133 g CO₂)
- $\underline{7}$. mother eats peanut butter (methane ethane propane butane), pentane hexane heptane octane; the number of C-and-H is C_nH_{2n+2} so it's CH_4 C_2H_6 C_3H_8 C_4H_{10} C_5H_{12} C_6H_{14} C_7H_{16} C_8H_{18} ; molar masses: 16 30 44 58 72 86 100 114

alkenes: names are like alkanes but with "ane" replaced by "ene": methene ethene propene butene pentene...; if one C=C, it loses 2 Hs; to see why, draw an alkane, then convert one C-C into C=C and (oops) two C's now have 5 bonds, so (because C wants 4 bonds) you must remove one H from each C, thus the loss of 2 H's; now convert an alkane into a cycloalkane, and you also see a loss of 2 H; for each, H's go from 2n+2 to 2n, and with C_nH_{2n} it's C_2H_4 C_3H_6 C_4H_8 C_5H_{10} C_6H_{12} C_7H_{14} C_8H_{16} and molar masses are 28 42 56 70 84 98 112 names: methene ethene propene butene pentene hexene ...

alkynes: eth<u>yne</u> propyne etc; formula is C_nH_{2n-2} (loses two more Hs; why?) - C_2H_2 C_3H_4 C_4H_6 C_5H_8 C_6H_{10} C_7H_{12} C_8H_{14} molar masses: 26 40 54 68 82 96 110

ENERGY BALANCE (on page 100 of CiC)

ENERGY BALANCES — incoming energy = outgoing energy is needed for a steady state with constant temperature in all of these ways: transient-radiation (100 = 6 + 25 + 46 + 23) and ultimate-radiation (100 = 6 + 25 + 60 + 9), atmosphere (23 + 37 = 60), earth (46 = 37 + 9). Figure 3.2 is simplified; it doesn't show some complex interactions; for example, "much of this heat is redirected and comes back..." (CiC, pgl108). Sun's EM radiation (UV, visible, infrared) differs (re: transmission, reflection, absorption, emission) as explained in CiC, shown by yellow, blue, red. 46% (of original) is emitted from earth, 37% is absorbed, so .37 / .46 = .80 = 80% which is the normal Greenhouse Effect. (if >80% is enhanced GE)

Math-Setups and Answers for Problems — 2a-2b, 3a

- 2a. (43.8 g C₅H₁₂) (1 mol C₅H₁₂ / 72 g C₅H₁₂) (5 mol CO₂ / 1 mol C₅H₁₂) (44 g CO₂ / 1 mol CO₂) = 134 g CO₂.
- $\underline{2b}$. Just "scale up" the reaction from grams to tons, so if 43.8 g C_5H_{12} produces 134 g CO_2 , then 43.8 tons C_5H_{12} will produce 134 tons CO_2 .
- 3a: (1 gal) (3785 mL/gal) (.70 g C₈H₁₈/mL C₈H₁₈) (1 mol C₆H₁₈/114 g C₈H₁₈) (8 mol CO₂/1 mol C₈H₁₈) (44.0 g CO₂/1 mol CO₂) = 8180 g
- The 2-page version (from 2010 & 2011), linked to in our sections-page, has extra topics: On page 1, the logic of "ping pong balls versus golf balls" and lightweight molecules vs heavy molecules (left column); the top-right ("These equations describe...") is "more than you need to know" so you can ignore it; Problem 4 (lower-right) emphasizes diatomics -- H A H, i.e. Hydrogen, Air (N₂, O₂), Halogens (F₂, Cl₂, Br₂, I₂), 1 2 4 -- and interpreting "hydrogen" (or "oxygen",...) as the diatomic molecule. On page 2, the two tables showing isomer-possibilities are overly complex, so Friday (Nov 9) I'll give you simplified principles & examples; the lower-left has useful ideas about Cl, and the top-right (re: Cl) is less essential but is #5h on the Study Guide for Quiz 7.
